

Food ordering app

The task is to create a food ordering app. The rough wireframe of the app is as below:

The section on the left contains a bunch of icon representing items. The right side initially is empty. Add and Remove are buttons in the center. When Add is clicked the selected item should be moved from left to right. If none are remaining, it should show a message indicating this. Similarly, when Remove is clicked, it should move the selected item from right to left. If none are remaining, it should show a message indicating this.

Points to be noted:

1. It should be a React project.
2. Bootstrap or Reactstrap should be used for CSS.
3. The page should be responsive.
4. The above wireframe is for reference. The actual design is given below.
5. You should have your code in GitHub and give us the link.
6. You also should publish your work and share that link as well.

Link to the design:

<https://xd.adobe.com/spec/e2a34903-ca08-46d2-606d-d168eefbe016-9492/>

- Nav links on top could be simply clickable with no action
- The images of the food could be any. You could download some.
- There are 4 art boards showing different states.

You have 1 day to finish this assignment. You can ping me on hangouts at danny@totalcloud.io or whatsapp/call me at +91-9880647287 if you have any questions.
